

FLIGHTRAX

User Manual & Training Guide

How to use FlightraX, step by step, for every role: students, flight instructors, the three admin departments, and the superadmin. From installing the app to filing, approving, flying, and closing out a flight.

FLIGHTRAX TEAM (RESEARCHERS)

MANZANO, KYLE CEDRICK G.

JOVES, DANIELA GEMAICA Z.

REYES, JUSTINE SHIN R.

GAÑALONGO, CHRISTAN BENEDICT G.

OSAYAN, GIAN CARLO V.

ABDON, DENMARK S.

This is the hands-on companion to the FlightraX Project Application document. That document describes what the system is and why; this one shows you what to press.

11 The Public Monitor (Lobby TV)

12 Notifications: What You Receive

13 Troubleshooting and FAQ

14 Quick Reference

1 Welcome

1.1 What FlightraX does for you

FlightraX replaces the paper side of a training flight. Instead of handwriting a CAAP flight plan, computing weight and balance on a clipboard, and walking the forms to an instructor, you do all of it in the app: the forms check themselves as you type, the instructor is notified the moment you submit, approval is a signed digital decision, and the whole school can see which aircraft are on ground, departed, or arrived — including a monitor in the lobby that needs no login.

Everything you file is kept: your flight log builds itself, and any approved flight can be downloaded as the official CAAP Form ATS 2019-1 and a weight and balance sheet, filled and signed.

1.2 The roles at a glance

Role	In one sentence
Student	Files flight plans and weight and balance sheets, submits them for approval, flies, and keeps their licenses and signature up to date.
Instructor	Everything a student does, plus reviewing and deciding the flight requests assigned to them.
Flight Operations Personnel (admin)	Verifies new accounts, maintains the aircraft, marks instructor leave, and posts the daily schedule.
Air Traffic Controller (admin)	Watches the organised flight board and audits completed and cancelled flights.
Safety Personnel (admin)	Posts and manages NOTAMs that appear on every dashboard and the lobby monitor.
Superadmin	The system owner's account: creates and recovers the admin accounts and holds the global configuration.

1.3 How to read this manual

- Everyone should read chapters **2** (getting started) and **12** (notifications). Students and instructors should also read **3** and **4** before their first flight.
- Then jump to your role's chapter: students **5**, instructors **5 and 6**, admins **7–9**, superadmin **10**.
- Steps look like numbered lists. Names of buttons and pages are written the way they appear on screen. Keyboard keys look like `Tab`. Web addresses look like `/monitor`.
- Chapter **13** collects the messages the app may show you and what to do about each; chapter **14** is a one-stop reference for field formats and codes.

TIP All clock times in FlightraX are **zulu (UTC)**, shown with a Z. Philippine time is zulu + 8 hours: 0800Z is 4:00 PM in Manila. The one screen that shows Philippine time by default is the lobby monitor.

2 Getting Started

2.1 Opening the app

FlightraX runs in the browser. Open `flightrax.app` on any phone, tablet, or computer. The home page offers sign-in, registration, and an install prompt.

2.2 Installing it on your phone

Installing puts the FlightraX icon on your home screen, launches it full-screen like a native app, and is required for push notifications on iPhone.

- 1 **Android (Chrome):** open the site, then tap the install prompt on the home page or in the sidebar — or use the browser menu's "Install app" / "Add to Home screen".
- 2 **iPhone / iPad (Safari):** tap the Share button, then "Add to Home Screen". Open FlightraX from that icon from then on.
- 3 **Desktop (Chrome / Edge):** click the install icon at the right end of the address bar, or the in-app install prompt.

2.3 Turning on push notifications

Push notifications tell you an account was approved, a request was decided, a flight moved, a NOTAM was posted, or the schedule is ready — without opening the app.

- 1 Sign in (or stay on the pending-approval page — it also offers the switch, so you learn your review outcome on your phone).
- 2 Find the enable-notifications control on the dashboard or in the notifications area and turn it on.
- 3 Accept the browser's permission prompt. On iPhone this only works from the installed home-screen app, not from a Safari tab.

You can enable push on several devices; each enabled device receives a copy. While the app is open in the foreground, the system banner is suppressed — the in-app bell updates instead.

2.4 Signing in and out

- 1 From the home page, choose Sign in and pick your role. **Students and instructors** pick theirs from the role picker.
- 2 **Admins** have no visible entry: on the login page, press and hold the plane icon until it "takes off" — that opens the admin sign-in.
- 3 Enter the email and password for your account. Credentials only work on your own role's page: a student's login is refused on the instructor page even if the password is right.
- 4 To sign out, use Logout in the sidebar or account menu. You return to your role's login page.

IMPORTANT Wrong-page sign-ins are refused on purpose. If your correct password is rejected, first check you are on the right role's login page.

2.5 Forgot your password

- 1 On the login page, choose Forgot password and enter your email.
- 2 Open the reset link from your inbox — it works even on a different device from the one you asked on.
- 3 Set a new password and sign in with it.

The confirmation message reads the same whether or not the email exists, so an outsider cannot use the form to discover accounts. Admins who never changed their temporary password are recovered by the superadmin instead (Section 10.3).

3 Creating Your Account (Students and Instructors)

Only students and instructors register themselves. Admin accounts are issued by the superadmin (Chapter 10). Every student and instructor registration is verified by Flight Operations Personnel before the account opens.

What you need before you start

- Your school or company **ID number**.
- A clear **photo or scan of your ID** (JPG, PNG, or WebP, up to 5 MB — large photos are shrunk automatically before upload).
- An email address that has not been used on FlightraX before.

Registering

- 1 From the home page choose Register and pick Student or Instructor.
- 2 Enter your full name in the form "**Lastname, First M.**" — for example "Santos, Rafael D.". This exact name goes onto your filed documents.
- 3 Enter your email, a password, and your ID number, and attach the ID image.
- 4 Submit. You land on the **pending-approval page**. Turn on push notifications there so your phone tells you the outcome.

While you are pending

Until you are approved, the pending page is the only page you can reach. Flight Operations Personnel see your request in their queue and approve it, or reject it with a reason.

If you are rejected

- 1 The pending page shows the reviewer's reason (for example, an unreadable ID photo).
- 2 Correct your name, ID number, or ID image right there and resubmit.
- 3 Your request returns to the queue marked as a resubmission, and the reviewers are notified.

TIP An ID number and an email can each belong to only one account. If the form says yours is already registered and that is a surprise, talk to Flight Operations Personnel before trying again.

4 Setting Up My Account

4.1 The three things every flight needs

Before you can file or decide anything, your account needs a **license**, a **signature**, and a **passcode**. The dashboard reminds you with a "No Licenses Detected" dialog until at least one license is on file.

Item	Why it matters
License	Filing a plan requires at least one valid (active, non-expired) license. Your licenses decide whether you can be pilot in command and whether you can self-approve.
Signature	Copied onto every flight plan and weight and balance sheet you file or approve. No signature, no filing.
Passcode	A four-digit code that confirms the serious actions: approve, reject, commence, terminate, cancel.

4.2 Profile photo, signature, and passcode

- 1 Open **My Account** from the sidebar.
- 2 **Photo:** upload a profile photo (JPG, PNG, or WebP, up to 5 MB). It appears in the header, sidebar, and directories.
- 3 **Signature:** draw your signature on the canvas with your finger or mouse and save it. Redraw and save again any time — documents you already filed keep the signature they were filed with.
- 4 **Passcode:** set a four-digit security code. Choose one you will remember at the aircraft; you type it every time you commence or terminate a flight.

4.3 Licenses and certificates

Adding a license

- 1 In My Account, open Licenses and add one.
- 2 Pick the type: **Student**, **Private**, or **Commercial** Pilot License, or **Flight Instructor** License.
- 3 Enter the license number, tick your ratings (Instrument Rating and a type rating for each aircraft type you are rated on), and set the expiry date — or mark it no-expiry.
- 4 Attach the front and back images of the card.

IMPORTANT An **expired license or certificate blocks you**: you cannot file, edit, or submit a flight plan, and you cannot be chosen as pilot in command, instructor, or schedule pilot while a credential on your account is expired. Renew it (update the expiry and images) to unblock yourself.

What your licenses let you do

You hold	You can
Any valid license (SPL included)	File plans and be named pilot in command.
A valid Private Pilot License (student)	Also self-approve your own request when you are the PIC.
Any valid license (instructor)	Also approve or reject requests you are assigned to.

Certificates

Certificates are free-form credentials: a title, description, optional expiry, and an image (a medical certificate, for example). Staff can see them in the directories. Expired certificates block filing the same way expired licenses do.

4.4 Changing your password

My Account → Change password: enter your current password and the new one. If your account was created with a temporary password (admins, superadmin), the app forces this step at first sign-in with a dialog that asks only for the new password.

5 Student Tutorial: Your First Flight

This chapter walks one flight from the posted schedule to your flight log. Instructors file exactly the same way — the differences are listed in Chapter 6.

5.1 Read the schedule

- 1 When Flight Operations posts the day's board you get one "schedule ready" notification. Open **Schedule** from the sidebar.
- 2 The board shows every aircraft as a row against a half-hour time axis. Find your slot: your name, the session type, the aircraft, and the times. The legend explains the colours.
- 3 If the school uploaded its Excel workbook instead, open the **Files** tab: pick your date on the month calendar and the workbook opens at that day's sheet.

The schedule is the plan on paper; the flight plan you file next is the record that actually books the aircraft. File it to match your slot.

5.2 Start a flight plan

- 1 Open **Flight Documents** and choose to create a new flight plan.
- 2 Pick your aircraft. Search by registration mark or filter by type. Only aircraft that are Active and fully set up are selectable; anything labelled "Needs admin setup" is not ready.
- 3 The flight plan form opens with your details and the aircraft's identification, type, and markings already in place.

5.3 Fill the flight plan, field by field

Field	What to enter
Date and time of filing	DDHHMM — the local day and the zulu clock time you are filing, pre-filled for you.
Date of flight	YYMMDD — the day you will actually fly. This is the date the aircraft is booked for, the date availability is checked against, and the date your flight appears on the boards.
Flight rules / type of flight	Single letters (V for VFR, G for general aviation, and so on — full list in Chapter 14).

Departure and destination	Pick from the Philippine aerodrome list. The school's home field RPT-20 Binalonan is filed as ZZZZ ; the form fills the location details into Other Information for you.
Departure time	HHMM zulu. Pre-filled to one hour after your filing time — change it to your real slot.
Cruising speed and level	ICAO formats, for example N0110 and A0015 (A0015 means 1,500 feet). The form explains each format as you type.
Route, total EET	Your route and estimated elapsed time (HHMM).
Endurance	Fuel endurance in HHMM. You may leave it blank while drafting, but you cannot submit without it.
Persons on board	Use the – / + stepper.
Emergency and survival equipment	Works like the paper form: cross out what you are NOT carrying . Anything you leave unmarked is declared as carried. Dinghies get a number, capacity, covered flag, and colour when carried.
Pilot in command	An instructor, or yourself — any valid license qualifies you to be named PIC, SPL included.
Flight instructor	Always required, even when you are the PIC. Instructors marked unavailable on your date of flight cannot be chosen.
Other Information	Auto-filled: DOF, DEP, DEST, ALTN lines and license lines. It must include your departure and destination locations.

TIP Every field validates as you type, in plain English. You can preview the filled CAAP form at any point while drafting — the pilot signature area stays blank until the plan is saved, and unapproved plans carry a DRAFT watermark.

- 1 Save the plan. It becomes a **Draft** with a plan code like **FP-260927-0412** — that code identifies this flight everywhere, including notifications.

5.4 Fill the weight and balance sheet

- 1 The Weight and Balance page opens after saving the plan (or open it from the document card).
- 2 The aircraft's basic empty weight, arm, and moment are already there from the fleet records.
- 3 Enter the usable fuel weight and moment, the instructor-plus-student weight and moment, and a weight and moment for each baggage area the aircraft type has.
- 4 The server computes the total weight, total moment, and centre of gravity, and grades the load **Within Limits** or **Overweight** against the type's maximum takeoff weight.
- 5 Record the balance status: Balanced, Nose Heavy, or Tail Heavy.
- 6 Save. The sheet is signed with your stored signature as the preparer.

IMPORTANT An Overweight result will not stop you saving the sheet — but fix the load before you fly. The sheet is a permanent record of what you declared.

5.5 Submit for approval

- 1 On the document card, choose Submit for approval.
- 2 The app refuses with a clear message if the weight and balance sheet is missing, the endurance is blank, or the aircraft is not Active.
- 3 On success the request becomes **Pending**. Your assigned instructor and your pilot in command are each notified immediately.
- 4 If you are your own PIC and hold a valid PPL, a **Self-approve** action appears — confirm it with your passcode and skip the wait.

5.6 While you wait: withdraw, edit, resubmit

- A pending request cannot be edited. To change something, **withdraw** it — it returns to Draft and the reviewers are told.
- If it is **rejected**, the card shows the reviewer's written reason. Edit the plan or sheet and submit again; reviewers see it labelled as a resubmission.
- Drafts and rejected plans can also be deleted, which removes the plan, its request, and its sheet.
- Your documents are grouped in tabs — In Progress (draft and rejected), Pending, and Approved — and searchable by plan code.

5.7 On the day: commence, terminate, cancel

Approved flights appear on the dashboard flight status board, on the lobby monitor, and — for the people on the flight — in the **today's flights drawer** on the dashboard. Only a flight's participants (the filer, the pilot in command, and the assigned instructor) can operate it.

- 1 Open the today's flights drawer on the day of the flight. Your flight shows as On Ground.
- 2 **Commence** when you depart, confirming with your passcode. The board flips your aircraft to Departed.
- 3 **Terminate** when you are back on the ramp, again with the passcode. The flight shows Arrived for about an hour, then clears from the board automatically.
- 4 **Cancel** (with passcode) if the flight will not happen — only while it is still on ground. Everyone on the flight is told who cancelled.

The app refuses a commence, with an explanation, when the aircraft is already on an active flight, when you or another participant is on another active flight, or when an earlier scheduled flight on the same aircraft today has not yet departed or been cancelled — in that case it offers you the earlier flight to cancel if it is yours to cancel.

IMPORTANT A flight that is never commenced by the end of its operations day is cancelled automatically overnight as a **no-show**, and every participant is notified. Cancel deliberately rather than letting a flight lapse.

5.8 Afterwards: downloads and your flight log

- From the flight's log page or document card, **download** the flight plan on the official CAAP form, the weight and balance sheet, or both in one PDF. The pilot column always shows the **pilot in command** — name, signature, and license line.
- Completed and cancelled flights appear in your **flight log** in My Account, with the full record: plan, sheet, and journey times.

6 Instructor Guide

You can do everything in Chapter 5. This chapter covers what is yours alone: the review queue. You will need your signature, passcode, and at least one valid license on file — approvals check all three.

6.1 Reviewing flight requests

- 1 Open **Flight Requests**. The **Assigned** tab lists pending requests where you are the flight instructor or the pilot in command — these are yours to decide. The **All** tab shows every pending request, for awareness only.
- 2 New submissions appear in the queue in real time, and you are also notified by push, with the plan code, aircraft, and zulu time.
- 3 Open a request to review the complete flight plan, the weight and balance sheet with its computed totals and status, and the journey details.

You cannot decide a request from the All tab if you are not its instructor or PIC — the buttons simply are not offered.

6.2 Approving and rejecting

- 1 **Approve:** confirm with your four-digit passcode. The system verifies your signature and license, checks the aircraft is Active, and checks no other flight already holds that aircraft at the same date and time. Your name, signature, and licenses are recorded on the documents as the approving authority, and the flight is scheduled.
- 2 **Reject:** enter your passcode and a written reason. The requester sees the reason on their card and can fix and resubmit.
- 3 Either way, the requester, the other reviewer, and the tower desk are notified. A request one reviewer has decided cannot be decided again by the other.

TIP Filing a plan yourself and set as your own PIC? You will see **Self-approve** on your own request — same passcode, same checks.

6.3 Flying as pilot in command

- Any active, non-expired license qualifies you to be PIC and to decide requests where you are the PIC.
- You appear in the PIC picker on every student's form — unless you are marked unavailable on their date of flight.
- You can commence, terminate, or cancel the flights you are part of (as filer, PIC, or assigned instructor) from your today's flights drawer. Flights you are not part of are monitoring-only.

6.4 Directories and credentials

- **Students:** the full directory with license and certificate tags; open a tag to see details and card images.
- **Instructors:** your colleagues, their credentials, and their upcoming unavailability.

7 Flight Operations Personnel Guide

You run the desk: the fleet, the account queue, instructor leave, and the daily schedule. Your home page is the aircraft manager.

7.1 Managing the fleet

An aircraft only becomes selectable for flight plans when all four steps below are done and its status is Active. Until then filers see it labelled "Needs admin setup".

- 1 Create the type** (once per model): name, ICAO designator (printed on flight plans), then its weight and balance specifications — usable fuel arm, seat arm, maximum takeoff weight, baggage limits, and up to six baggage areas with arms. Adding a type also creates a matching type rating people can put on their licenses.
- 2 Create the aircraft:** registration mark and number, serial, colour and markings, an optional photo, and remarks.
- 3 Set its basic empty weight,** arm, and moment — these preload every weight and balance sheet filed on it.
- 4 Keep the status honest:** Active, Maintenance, Grounded, or Retired. Maintenance and Grounded block new submissions and approvals; Retired asks filers to pick another aircraft. Changing status away from Active automatically notifies everyone on that aircraft's upcoming flights.

A type that aircraft still use cannot be deleted, and registration marks must be unique.

7.2 Reviewing new accounts

- 1 Open Account Review.** The queue shows each applicant's name, email, ID number, and a preview of the uploaded ID image, plus pending / approved / rejected counts per role. You are notified whenever someone registers.
- 2 Compare the ID image with the typed details. Approve** to open the account — the person is notified and taken to their dashboard.
- 3 Reject** with a written reason the person can act on ("ID photo is blurred, please re-upload"). They see it on their pending page and can resubmit; resubmissions return to the queue labelled as such.
- 4** A request a colleague already decided cannot be decided twice.

7.3 Instructor unavailability

- 1 Open Instructors** and add an unavailability period (a date range) to the instructor on leave.
- 2** While the period covers a date, that instructor cannot be chosen as PIC or instructor on any plan with that date of flight. All students are notified when a period is added.

- 3 Periods cannot overlap and cannot lie wholly in the past; expired periods clean themselves up.

7.4 Posting the schedule

- 1 Open **Schedule** and pick the day. Every aircraft is a row; click a cell to post an entry.
- 2 Set the start and end time, pick one of the eleven session types (Chapter 14 lists the codes), and choose a pilot and/or an instructor from the approved people — or type a free-text note for Out of Service and To Be Determined.
- 3 Entries on the same aircraft cannot overlap; back-to-back is fine. Edit or delete entries at any time — edits are silent.
- 4 When the day is ready, hit **Ping everyone**: one notification to every approved user, linking to the board. The confirmation warns you if the day was already pinged and by whom — re-ping only on purpose.

7.5 Uploading schedule workbooks

- 1 On the Schedule page open the **Files** tab and upload the school's Excel workbook as-is (.xlsx, up to 4 MB, covering up to two months; two files cannot cover the same date).
- 2 Set the date range it covers. The server parses every sheet; the month calendar paints the covered dates, and opening a date opens the workbook viewer at that sheet.
- 3 Everyone is notified of the upload. The original file remains downloadable, and you can remove an upload if it was wrong.

8 Air Traffic Controller Guide

You watch and you audit. You are notified of every approved flight, your home page is the organised board, and the Flight Plans page is your archive.

The organised board

- Your dashboard groups today's flights by status — on ground, departed, arrived — with trainee, PIC, instructor, route, and times, updating in real time.
- Delayed flags mark scheduled flights whose time has passed; a second flag marks active flights airborne longer than their filed EET.
- Active NOTAMs and a live zulu clock sit alongside. The board is monitoring only — operating a flight belongs to its participants.

The flight plans audit

- 1 Open **Flight Plans**. Every flight that reached the end of its life — arrived or cancelled — is listed.
- 2 Search by aircraft, trainee, or PIC; filter completed against cancelled.
- 3 Open an entry for the full flight log — the plan, the weight and balance sheet, and the journey with who commenced, terminated, or cancelled and when — and download the official documents from there.

9 Safety Personnel Guide (NOTAMs)

NOTAMs are the notices everyone sees: on the dashboards, in notifications, and on the band at the bottom of the lobby monitor. Your home page is the organised flight board; the NOTAMs page is yours to manage.

Posting a NOTAM

- 1 Open **NOTAMs** and create a notice.
- 2 Write a title (up to 200 characters) and a description (up to 300 — the limit keeps it readable on the TV in one band).
- 3 Pick the severity: **Advisory**, **Warning**, or **Alert**.
- 4 Set the expiry date — today or later. The NOTAM stays active until the end of that day, Philippine time, then moves itself to the Expired tab.
- 5 Post. Everyone except Flight Operations Personnel is notified, and the notice appears on dashboards and the monitor immediately.

Managing notices

- The Active and Expired tabs keep the history browsable.
- Only the author can delete a NOTAM, and deleting sends no notification — post a correcting NOTAM instead if people need to know.

10 Superadmin Guide

There is exactly one superadmin account, and it is never registered — it is created by the operator's seeding command. Its job is the administrative accounts and the system configuration.

10.1 Signing in for the first time

- 1 On the FlightraX home page, tap the **FlightraX logo five times in quick succession**. The superadmin sign-in page opens. (There is no visible link anywhere.)
- 2 Sign in with the seeded credentials handed to you by the operator.
- 3 A dialog immediately requires a new password — it cannot be dismissed or clicked around, and it asks only for the new password. Set one; from then on you sign in with it.
- 4 Logout returns you to the superadmin login page, like every other role.

IMPORTANT If the superadmin password is ever lost, the operator re-runs the seeding command: it resets the account to the seeded state, and the next sign-in forces a fresh password again. Nobody else can recover this account.

10.2 Creating an admin account

- 1 Open **Admins** (under Users). The table lists every admin with name, email, department, and a Password column showing "Temp password" or "Updated".
- 2 Choose **Create Admin** and enter the person's full name ("Lastname, First M."), email, and department: Flight Operations Personnel, Air Traffic Controller, or Safety Personnel. The department is fixed for the account's lifetime.
- 3 The dialog shows the result exactly once: a generated temporary password like **tmp-xxxx-xxxx**, hidden behind a reveal toggle, plus a ready-to-send **handoff message** naming the login page. Copy it now — the password is never shown again.
- 4 Send the handoff message to the new admin through a channel you trust. Their account works immediately: no review queue, and their first sign-in forces a password change just like yours did.

TIP The Password column tells you who has completed their handoff: "Updated" means they have set their own password; "Temp password" means they have not signed in yet — or lost the note.

10.3 Recovering a locked-out admin

- 1 An admin who has already set their own password uses the ordinary Forgot password email flow — nothing for you to do.
- 2 An admin who lost an unused temporary password: find their row and use **Regenerate Temp Password**.
- 3 Confirm. The old temporary password stops working immediately, and you get a fresh one-time reveal and handoff message. Their next sign-in forces a change as usual.

10.4 Navigation configuration

- Out of the box your own navigation is deliberately minimal: Home, Instructors, Students, Admins, your account, and notifications. Typing other URLs redirects to your dashboard.
- A single system setting, **superadmin_full_navigation**, opens every page and route to the superadmin when enabled. It lives in the application's settings store in the database and is changed by the system maintainer, not from a screen; the change takes effect on your next page load, with no redeploy.
- Your permissions are never the limit — the superadmin passes every permission check. The setting only shapes how much surface your account exposes day to day.

11 The Public Monitor (Lobby TV)

The monitor is a no-login web page made for a television: big type, no scrolling, self-refreshing. Anyone can open it; nothing on it links anywhere or exposes account data.

Setting up the TV

- 1 On the TV's browser (or a stick / mini-PC driving it), open `flightrax.app/monitor`.
- 2 Move the mouse once and click the fullscreen control, or press `F`.
- 3 Leave it. The board polls the server every ten seconds and rotates through its three screens — **On Ground**, **Departed**, **Arrived** — every twenty seconds, seven rows per page.

Reading and options

- Each row shows the registration mark, trainee, instructor, destination, the time of flight or departure, and the elapsed or estimated time.
- Active NOTAMs rotate on the band along the bottom, ten seconds each.
- Times show in **Philippine time** by default. Press `Tab` to switch the screen to zulu and back; the choice is remembered on that screen.
- To check the layout on a new TV before there are real flights, open `/monitor-preview` — the same board filled with sample data.

12 Notifications: What You Receive

Notifications arrive in-app (the bell on desktop, the notifications page on mobile) and as push messages on devices where you enabled them. Every row deep-links to the page it is about and is marked read when you open it; Mark all as read clears the badge.

The ground rules

- You are never notified about something **you** did.
- Flight messages always name the flight: plan code, registration, zulu time. When a person acted, they are named; when the system acted (a no-show sweep), the message says so in passive voice.
- Per-flight events reach only that flight's participants — the boards and the monitor exist for fleet-wide awareness.

Who gets what

Event	You are told when...
Account submitted / resubmitted	you are Flight Operations Personnel and someone registers or resubmits.
Account approved / rejected	it is your account being decided (with the reason on rejection).
Flight request submitted	you are the assigned instructor or the PIC on it — the message says which one you are.
Flight request approved	you are the requester or the other reviewer; the tower desk is told of every approval.
Flight request rejected / withdrawn	you are the requester or a reviewer on it (rejections carry the reason).
Flight commenced / arrived / cancelled / no-show	you are a participant of that flight.
Aircraft status changed	you are a participant of a live flight on that aircraft.
NOTAM posted	always — everyone except Flight Operations Personnel.
Instructor unavailable	you are a student.
Schedule ready / file uploaded	always — every approved user.

No notification is sent for drafts, sheet saves, credential or profile edits, password or passcode changes, schedule entry edits, NOTAM deletions, or the automatic standby transition an hour after arrival.

13 Troubleshooting and FAQ

Every refusal in FlightraX is a plain sentence telling you what to do. This table maps the common ones, and the common surprises, to their fix.

What you see or wonder	What it means and what to do
My correct password is refused at sign-in.	You are probably on another role's login page — credentials only work on your own role's page. Go back and pick your role again.
I can only see a "pending approval" page.	Your registration has not been approved yet (or was rejected — the reason shows there). Wait for review or fix and resubmit.
A dialog says No Licenses Detected.	Add at least one license in My Account. You cannot file without one.
I cannot pick myself as pilot in command.	Your licenses are missing or expired. Any <i>valid</i> license lets you be named PIC; renew what expired.
I filed the plan but cannot submit it.	Read the message: the weight and balance sheet is missing, the endurance is blank, or the aircraft is not Active. Fix the named item and submit again.
An instructor I want is not selectable.	They are marked unavailable on your date of flight, or a credential of theirs has expired. Pick another instructor or another date.
The aircraft I want says "Needs admin setup".	Its type specifications or basic empty weight are incomplete. Ask Flight Operations Personnel to finish its setup.
Approval was refused because the aircraft is taken.	Another flight already holds that aircraft at the identical date and time — the message names whose. Change the time or aircraft and resubmit.
Commence is refused.	The aircraft or one of the flight's people is still on another active flight, or an earlier flight on the same aircraft today has not departed or been cancelled yet — the app offers it for cancellation when it is yours to cancel.
My flight disappeared from the board an hour after landing.	Normal: arrived flights move to standby automatically to clear the aircraft. The flight is in your flight log and the audit.
My flight was "automatically cancelled (no-show)".	It was never commenced by the end of its operations day, so the overnight sweep closed it. File a new plan for the next attempt.
I edited my signature — why do old documents show the old one?	By design. Documents snapshot your name, signature, and licenses at filing and approval; later profile changes never rewrite filed paperwork.
Why does the printed form show the PIC in the pilot box and an empty representative box?	The school's convention: the pilot column always carries the pilot in command, and the Duly Authorized Representative column is left blank. Who approved is stored in the system's records.
The form preview shows a big DRAFT watermark.	The plan is not approved yet. The watermark disappears from documents once the request is approved.

I pressed a button twice on bad signal — did it double?	No. Repeats within the protection window are treated as the same action: no duplicate records, no duplicate notifications.
I am not getting push notifications.	Check the enable switch, then the browser's site permissions. On iPhone, push only works from the installed home-screen app. Notifications always appear in-app regardless.
An admin lost their password.	If they had already set their own: Forgot password by email. If they never got past the temporary password: the superadmin regenerates it (Section 10.3).
Who fixes wrong fleet data, my locked account, or the schedule?	Flight Operations Personnel — fleet, accounts, unavailability, schedule. Safety Personnel — NOTAMs. The superadmin — admin accounts themselves.

14 Quick Reference

Time, in one box

Clock times on forms	Zulu (UTC), with a Z. Manila = zulu + 8. 0800Z = 4:00 PM Manila.
Date and time of filing	DDHHMM — local (Manila) day + zulu clock. Departure time defaults to one hour later.
Date of flight	YYMMDD — the day you fly; drives the boards, conflicts, and availability.
"Today"	Always the Manila calendar date.

Flight plan field formats

Field	Format
Flight rules	I (IFR), V (VFR), Y (IFR then VFR), Z (VFR then IFR)
Type of flight	S scheduled, N non-scheduled, G general aviation, M military, X other
Wake turbulence	L light, M medium, H heavy
COM/NAV equipment	N none, S standard
Surveillance	N none, A transponder Mode A, C transponder Mode A and C
Aerodromes	Four-letter ICAO code, or ZZZZ (home field RPT-20 Binalonan)
Cruising speed	K or N + four digits, or M + three (N0110)
Cruising level	VFR, F/A + three digits, S/M + four (A0015 = 1,500 ft)
EET / endurance	HHMM (endurance required at submission)
Persons on board	Digits, or TBN
Emergency equipment	Cross out what is NOT carried; unmarked = carried
Plan code	FP-YYMMDD-NNNN, assigned at first save

Statuses

Object	States
Flight request	Draft → Pending → Approved / Rejected (withdraw returns Pending to Draft)
Flight journey	Scheduled (On Ground) → Active (Departed) → Arrived → Standby; or Cancelled
Aircraft	Active / Maintenance / Grounded / Retired
Weight sheet	Within Limits / Overweight; Balanced / Nose Heavy / Tail Heavy
NOTAM	Active until end of expiry day (Manila) → Expired

Schedule session codes

PS	Pre-Solo Simulator	People
TAXI	Taxi Exercise	People
LCL	Local Flight	People
XC	Cross Country Flight	People
IRS	Instrument Simulator	People
CAAP	CAAP Checkride	People
CF	Company Flight	People
OTS	Out of Service	Note
TBD	To Be Determined	Note
CT	Cross Trainees	People
UPRT	Upset Prevention and Recovery Training	People

Upload limits

Images (ID, license, certificate, profile, aircraft)	JPG, PNG, or WebP; 5 MB max; auto-shrunk above 1 MB
Schedule workbook	.xlsx; 4 MB max; up to two months per file
NOTAM	Title 200 characters; description 300

Who to ask

Account approvals, fleet, schedule, instructor leave	Flight Operations Personnel
NOTAMs	Safety Personnel
Flight history and documents after the fact	Air Traffic Controller
Admin accounts and their passwords	Superadmin
The superadmin account itself, system settings	The system maintainer (seeding command / configuration)

FLIGHTRAX: User Manual, v1.0, 27 September 2026. Prepared by the FlightraX Team (Researchers): MANZANO, KYLE CEDRICK G.; GAÑALONGO, CHRISTAN BENEDICT G.; JOVES, DANIELA GEMAICA Z.; OSAYAN, GIAN CARLO V.; REYES, JUSTINE SHIN R.; ABDON, DENMARK S. Companion to the FlightraX Project Application v1.3. Based on application version 0.1.0.
